

Calibration under personalized heads explains the C-triplet gain

(a) C-triplet / C-hole MAE under four configurations

(b) Paired effect-size forest plot (E71 contrasts + PC² ablations)

(c) Mechanism summary

- E71 $\approx$ E66 (n.s.; p = 0.929)
FedPer + calibration reproduces PC²-FedReorg.
 - E71 < E63 (nominal p = 0.028)
Calibration alone improves over plain FedPer.
 - E71 < E70 (nominal p = 0.021)
Removing calibration is more harmful than removing adapter + gate.
-
- Gate is not required for the observed C-triplet gain in this federation; retained as auditable compatibility metadata only.
- C-hole remains at a small-sample data ceiling (all p $\geq$ 0.42).
